Education

Santa Clara University

Santa Clara, CA

Bachelor of Science in Computer Science, Minor in Mathematics / GPA: 3.5/4.0

Expected Dec 2027

- **Coursework:** Data Structures & Algorithms, Software Engineering, Object-Oriented Programming, Operating Systems, Machine Learning, Computer Networks, Computer Security, Embedded Systems, Linear Algebra

Work Experience

Innodisk

Jun – Sep 2026

Software Engineering Intern (AI Solutions & Systems)

Fremont, CA

- Collaborated within a 50-person cross-functional engineering department to validate Innodisk's proprietary APEX and AXMB AI solutions, ensuring enterprise-grade stability and reliability under sustained workloads.
- Executed hundreds of comprehensive diagnostic test suites across heterogeneous hardware configurations, identifying and isolating critical memory leaks and thermal limits prior to client deployment.
- Spearheaded a hardware optimization initiative, dismantling 20+ legacy servers and repurposing salvaged components to engineer custom high-performance test environments for AI frameworks.

Innodisk

Jul – Sep 2023

Software Engineering Intern (Firmware & Systems)

Fremont, CA

- Engineered 50+ automated test scripts and internal diagnostic tools in C++ and Python to validate SSD and HDD firmware, reducing manual QA cycle times by 40%.
- Debugged and validated low-level kernel drivers and storage firmware across Linux and Windows environments, diagnosing and logging 100+ critical pre-release defects.
- Collaborated with cross-functional QA and development teams to conduct root-cause analysis on hardware-software compatibility issues, cutting average defect turnaround time by 30%.

Competitive Programming Club

Sep 2024 – Jun 2025

Underclassmen Representative

Santa Clara, CA

- Organized and directed 3 internal algorithmic coding competitions, driving a 100% increase in student turnout from 50 to 100+ attendees over the academic year.
- Mentored underclassmen on core data structures, algorithmic complexity, and efficient problem-solving strategies.

Personal Projects

Home Server & Self-Hosting Infrastructure

Jun 2026 – Present

Proxmox VE, Debian, Docker, ZFS, CUDA/NVENC, Tailscale, Prometheus/Grafana

- Architected a virtualized homelab on Proxmox VE (Debian) with redundant 13TB ZFS pools and NVIDIA GPU PCIe passthrough, running 10+ containerized services across isolated VMs; balanced GPU VRAM across NVENC transcoding, CUDA object detection, and local Ollama LLM inference with automated model unloading.
- Built an n8n + local-LLM (Qwen 2.5) pipeline that parses Gmail job alerts; isolated traffic with gluetun VPN network namespaces, enabled zero-trust remote access via Tailscale mesh VPN, and built Prometheus/Grafana observability for host thermals, VRAM, and ZFS pool health.

EduDeals (Berkeley AI Hackathon)

2026

Python (httpx, BeautifulSoup, Gemini API), Supabase (PostgreSQL), React, TypeScript

- Engineered an automated data extraction and LLM ingestion pipeline in Python utilizing Gemini API and BeautifulSoup to harvest and structure deal listings across dynamic web sources.
- Designed and integrated a scalable Supabase/PostgreSQL schema to index structured records for rapid querying and search retrieval.

Technical Skills

Languages: C/C++, Python, Java, Assembly, JavaScript, TypeScript, SQL, Swift

Systems & Infrastructure: Linux/Unix, Docker, Proxmox VE, ZFS, Tailscale, Prometheus/Grafana, Git/GitHub, Networking

Frameworks & Cloud: Node.js, Express.js, React, Flask, Socket.io, AWS (S3, Rekognition), Supabase, PostgreSQL
